

time you spend on the same program, the more success you will have. Over time you begin to learn how the developers are thinking without even needing to meet them based on how they patch issues and when new features are created (new bugs, or same bugs reintroduced?). Always think about the bigger picture.

I really enjoy the challenge behind hacking and working out the puzzle without knowing what any of the pieces look like. Hacking forces you to be creative and to think outside the box when building proof of concepts (PoC) or coming up with new attack techniques. The fact the possibilities are endless when it comes to hacking is what has me hooked and why I enjoy it so much.

I have shared lots of content with the community and even created a platform in 2018 named BugBountyNotes.com to help others advance their skills. I shut it down after running it for a year to re-design the platform & to re-create the idea, which you can now find on BugBountyHunter.com.

To date, I have helped over 500 newcomers and helped them discover their first bug and some have even gone on to earn a sustainable amount over the years. But I am only 10% of the equation, you have to be prepared to put in the time & work. The 90% comes from you. Time and patience will pay off. Get firmly in the driver's seat and make hacking on bug bounty programs work for **you**.

You're the one producing the results.
